

OLLIVANDER'S INVENTORY

Write a query that determine the minimum number of coins needed to buy each non-evil wand of high *power* and *age*. Print the *id*, *age*, *coins_needed*, and *power* of the wands, sorted in order of descending *power*. If more than one wand has same *power*, sort the result in order of descending *age*. The mapping between *code* and *age* is one-one, meaning that if there are two pairs, $(code_1, age_1)$ and $(code_2, age_2)$, then $code_1 \neq code_2$ and $age_1 \neq age_2$. Tables are provided below:

Wands

Column	Type
id	Integer
code	Integer
coins_needed	Integer
power	Integer

Wands_Property

Column	Type
code	Integer
age	Integer
is_evil	Integer
